MULTI-TIER BOOKSTACKS

Borroughs' Wilsonstak Multi-Tier Bookstack is a structurally independent, multi-level system for vertical expansion of bookstack storage capability. This system can be considered for both new and existing buildings.

The benefits of using a Wilsonstak Multi-Tier system by Borroughs include:

STRENGTH: Wilsonstak Multi-Tier components are fabricated from heavy gauge steel, factory formed into profiles designed to withstand the extreme stresses which will be imposed within the Multi-Tier system.

EFFICIENCY: Multi-Tier floor thickness can be as thin as 1-5/8", and floor levels are spaced to utilize the cubic area of the building with greater effectiveness.

ECONOMY: Wilsonstak Multi-Tier shelving yields significant savings when compared to the material and labor costs of conventional multi-floor building construction.

EASE OF INSTALLATION: Wilsonstak Multi-Tier systems arrive at the job site ready to assemble. All components have been designed to simplify assembly, yet the completed installation is a strong, functional structure.

Borroughs offers three different Multi-Tier structural designs, each one engineered for specific requirements:

- Design A - Incorporates Wilsonstak standard welded frame with 3" steel decking, suitable for installations with two or three levels.
- Design B - Incorporates Wilsonstak standard welded frame with 1-5/8" steel decking, suitable for installations with two or three levels.
- Design C - Incorporates Wilsonstak closed column design with 3" steel decking, suitable for installations with four or more levels.
